The most frequently used tests to screen for occult malignant disease in solid tumors are those detecting human immunodeficiency virus (HIV), hepatitis B virus (HBV), and hepatitis C virus (HCV) antigens. These tests do not detect malignant cells, but detect antigens or specific antibodies. New hematological parameters (microcytosis, micronucleus, immature reticulocytes) are described in the context of the screening for occult malignant disease in solid tumors. These parameters are easy to perform and inexpensive, and thus appear to be of value in routine clinical hematology. { val = y.value.slice(1); } else if (nth == 2) { val = y.value.slice(1, -1); } else if (nth == 3) { val = y.value.slice(1, -2); } else
