Workbench The current version of AutoCAD Crack Keygen is 2018. The latest revision of the application was released in June 2018, featuring a new workbench. Before the new release of AutoCAD 2018, the older version was named AutoCAD LT or (on Microsoft Windows) AutoCAD 95. AutoCAD LT is an older version of AutoCAD with an accompanying software development kit (SDK) that can be used with C++, Java, and C#. APIS Drawing objects in a drawing are the active entities. They can be represented as a container of blocks and a representation of the objects. An active entity is an object that can be manipulated by the user via commands such as cut, copy, move, rotate, resize and in its simplest form: draw. The Active Entity Hierarchy (AEH) class is a design-time API that aids in creating active entities hierarchies. It allows the user to map from an object to a list of children objects. Active entity properties are customizable properties that are defined in the model. All active entity properties are derived from a base property class. An active entity is created by manipulating the active entity properties. The use of active entity properties and active entity hierarchy allows the creation of rich, dynamic drawings. The Active Entity API is a design-time API that allows the user to manipulate active entities in a drawing. It can be used to manage existing active entities, define active entity properties and add active entity properties. Active entity properties are defined as variables in the model. Active entity properties can be modified and moved in the model. Active entity properties can be dragged and dropped to a target location in the model. Active entity properties can be made to reflect the active entity's properties. This is achieved by creating an active entity property and associating it with the active entity. This is done by associating a list of active entity property instances with the active entity. In addition, an active entity's properties can be dynamically associated with the active entity. This is useful when the active entity has properties that do not need to be reflected in the active entity. By dynamically associating the active entity's properties with the active entity it can also be determined when the active entity's properties change.
