It is much like bs-spectrum, but it can process a .wav or .mp3 file and it shows the graph. Adhesion properties of bis(p-nitrophenyl)phosphate-modified microspheres on stromal cell surfaces. Chondrocyte suspension culture was used to evaluate the effects of biocompatible, biodegradable polymeric materials on stromal cell adhesion. Hydroxyethyl methacrylate, ethylene dimethacrylate, ethylene glycol dimethacrylate, poly(methyl methacrylate), and poly(ethylene glycol) monomethyl ether methacrylate-methacrylate were selected as the monomers. Methacrylate polymers were mixed with appropriate cross-linking monomers and bis(p-nitrophenyl)phosphate as an adhesion-promoting reagent. The effects of these compounds on the adhesion of pre-cultured stromal cells to microspheres were studied using the pre-contact assay. The monomer types were ordered according to their reactivity, including the effect of the resulting polymers on the adhesion of pre-cultured chondrocytes to microspheres. Bis(p-nitrophenyl)phosphate-modified methacrylate polymers were very effective in promoting the adhesion of pre-cultured chondrocytes to the microspheres. Polymers containing methacrylate groups had much better adhesion-promoting activity than those containing ethylene glycol dimethacrylate, ethylene dimethacrylate, poly(ethylene glycol) monomethyl ether methacrylate-methac
