Autodesk AutoCAD Wiki AutoCAD is a state-of-the-art piece of software. With AutoCAD and a graphics tablet, you can quickly produce two-dimensional drawings of almost any shape and style, using a set of commands and tools that make it easy to see your results in 3D. It's a tool of choice for engineers, architects, landscape architects, and more. AutoCAD 2.5 introduced the concept of drawing blocks, and since then, those drawings have become increasingly more sophisticated and complex. Autodesk AutoCAD Wiki What is AutoCAD? AutoCAD is a leading commercial computer-aided design (CAD) and drafting software application. Developed and marketed by Autodesk, AutoCAD was first released in December 1982 as a desktop app running on microcomputers with internal graphics controllers. Before AutoCAD was introduced, most commercial CAD programs ran on mainframe computers or minicomputers, with each CAD operator (user) working at a separate graphics terminal. AutoCAD is also available as mobile and web apps. AutoCAD Wiki The earliest AutoCAD products were CAD programs for use on desktop microcomputers. They allowed CAD users to interact with graphics hardware and generate 2D drawings using high-resolution images stored in image files. This type of CAD was introduced in 1981 by Autodesk as AutoCAD for the MIT-licensed Desk-TOP Autocad System (DAS), which consisted of the DAS operating system and the Autocad program. AutoCAD's name comes from the idea that it provides CAD for desktop "real time," as it were, rather than batch processing (it is not an "automated" CAD program). AutoCAD 2.5 introduced the concept of drawing blocks, and since then, those drawings have become increasingly more sophisticated and complex. With AutoCAD, you can quickly produce two-dimensional drawings of almost any shape and style, using a set of commands and tools that make it easy to see your results in 3D. It's a tool of choice for engineers, architects, landscape architects, and more. AutoCAD is used by most small and medium sized businesses (SMBs) and large enterprises worldwide. It is used to design and produce practically any type of geometric figure, surface, or assembly, as well

When the labels are set, you know it, since the labels change the color, and so on. However, they have to be there, since there are some complex interactions. I would like to avoid labels when the visitor is not interested in it. Is there a way to do this? For example, when I visit [www.semantic-ui.com](http://www.semantic-ui.com) and click on contact, I want to show a bigger version of the contact section without it needing the label. A: The labels property is a way to make each element stand out on its own. It can be read here: However, in your example above, if I scroll down to the contact section, you can see the section's labels: So, I think the issue here is that this is a responsive website, so you cannot always assume that a given element will always be displayed on-screen. As you stated in the comments, you can style each label to act like a button. Here's an example from the documentation: You can style the labels like you would any other element, and it should work as desired: a1d647c40b
