The present invention relates to apparatus for driving a recording head of a thermal ink jet recording apparatus. A conventional drive apparatus of a thermal ink jet recording apparatus is generally provided with a plunger, which is movable in a direction of a recording sheet, for moving a recording head in a direction perpendicular to a feeding direction of the recording sheet. In this type of drive apparatus, the head can be moved toward the recording sheet with the reciprocating movement of the plunger. In this case, however, a higher drive frequency is required for moving the recording head because the head is moved in a direction perpendicular to the feeding direction of the recording sheet. Therefore, it is very difficult to drive the head by the conventional drive apparatus in a high-speed printer capable of recording an image at a recording density of 400 dots per inch. As a result, the drive frequency is reduced. In this case, however, the recording head is not moved in a direction perpendicular to the feeding direction of the recording sheet. As a result, the amount of ink ejected from the recording head is reduced. The reduction in the amount of ink ejected from the recording head leads to unstable ejection of ink. To overcome the above problem, the present applicant has proposed a drive apparatus, as disclosed in U.S. Ser. No. 07/976,047, incorporated herein by reference, in which the head is driven in the feeding direction of the recording sheet as well as the direction perpendicular to the feeding direction of the recording sheet, so that the head can be moved in the direction perpendicular to the feeding direction of the recording sheet in an appropriate manner. The drive apparatus includes an electromagnet, for moving the plunger, and a plurality of coils, which are selectively energized or de-energized by driving circuit means, for driving the electromagnet. Improvements for the drawing viewport and Block Editor: Reduce the size of the ViewPort, and use a smart display of blocks and blocks within blocks to show more information for better understanding of a drawing. The ViewPort is smaller. It automatically adjusts to show only what's needed when you're zoomed in. This makes it easier to see the complete drawing when you open the ViewPort to show the drawing. You can display many blocks and blocks within blocks. To learn more, see Using the Block Editor to Organize Your Drawing. Support for the Autodesk Seek Framework: Seek and annotate drawings on the Go using the Autodesk Seek Framework. You can navigate, move, and zoom drawings, images, and objects with your device or platform's inertial navigation technology.
