

Basic File Types Photoshop supports five types of file formats: JPEG, TIFF, GIF, RAW, and PSD. With recent versions of Photoshop, JPEG and TIFF files can now open as layers, which is handy for creating a layered file. JPEG and TIFF files can be saved in several different formats, such as RGB, CMYK, and Web-based PNG. The RAW file format is proprietary and requires Adobe's popular DNG standard, for which there are many converters. Photoshop files can also be saved in PSD (Photoshop document) format, which is a very efficient file format for saving all Photoshop layers and settings. Layers Layers are Photoshop's central editing technology. They allow you to apply multiple edits to the same image or to separate edits to different layers, which enables the creation of complex composites. Photoshop has a separate layer for everything you do to an image, and you can perform tasks on any of the image's layers. A layer is an image on its own—that is, if the image on the layer has its own blend modes, the layer's grayscale and opacity settings are separate from the other layers, and individual layers can have their own mask settings, mask types (black-or-white) and masks. Not only does Photoshop let you create and modify layers, but it allows you to use layers as standard Photoshop image layers, which means that you can save a layer as a file in the usual image format. Although you can also save a layer as a Photoshop file, there are several reasons why you should always save a Photoshop file as a layer, instead of as an image, even if you aren't using the layer. The most important reasons are that the Photoshop file format is more efficient and flexible than the image format, and also because the layer format is easier to work with when you are using Photoshop. The layer format has three parts: the name of the layer, its type, and its setting. A type of layer is either bitmap or vector. Bitmap layer types can be color or grayscale. There are also three layersetting types: absolute, relative, and reference. An absolute layer's setting is always set to the same setting as the other layer's settings. A relative layer's setting is always set to whatever you last set it to. A reference layer's setting is always set to the same layer's settings. Layers The Layers palette

Q: Difference between "into" and "in" Could anyone tell me the difference between the two prepositions in the sentences below? You need to be very careful when you are into a new town. You need to be very careful when you are in a new town. A: It is highly unlikely that you would be in a new town. It is highly unlikely that you would be into a new town. They both mean "into", but the former is more likely. Our previous work indicates that the surface (membrane) of secretory vesicles from normal and cystic fibrosis (CF) airway cells is significantly different from that of vesicles from secretion-defective cells (Streeter, E., and R. B. L. Horwitz (1981) "Proteins of the cytosol of human beta-cells identified by surface radioiodination and SDS-polyacrylamide gel electrophoresis", Proc. Natl. Acad. Sci. U.S.A. 78:3048-3052). As part of this work, we have also demonstrated a lack of association between the surface-associated (membrane) protein and the marker for intracellular organelles, the alpha-subunit of the vacuolar H⁺-ATPase. Studies on oviductin, a vesicle-associated glycoprotein purified from porcine oviductal mucosal secretions (McNeil, C., and R. B. L. Horwitz (1982) "Characterization of surface proteins of normal and cystic fibrosis secretory cells by surface radioiodination and SDS-polyacrylamide gel electrophoresis", J. Biol. Chem. 257:5770-5776) have revealed that a Mr 65,000 surface-associated polypeptide from normal airway cells is also absent from secretory vesicles in cells from subjects with CF (Lyons, J. C., and R. B. L. Horwitz (1983) "Electron microscopy of surface radioiodination labeling of human secretory cells", Cell 33:1093-1104). Electron microscopy of the surface-labeled vesicles from normal and CF airway cells revealed that the labeled surface-associated material was concentrated over the vesicles. Since this work was published, two

The Eraser tool allows you to remove portions of an image. The Gradient tool allows you to fill one area of an image with a certain color. It is also used to create smooth transitions between two areas. The Healing Brush is useful for removing inconsistencies in an image. The Lasso tool allows you to draw a specific area of the image. You can then drag it to another area. The Magic Wand tool allows you to pick out a specific color within an image. The Paint Bucket allows you to paint the portions of an image with a specified color. The Pencil tool allows you to draw on an image with brush size, opacity and color. Photoshop brushes can be found on the Brush menu. They vary depending on the shape and size of the brush. Brushes with a regular circle, line, triangle or star shape are commonly found. They can be used for everything from lighting an object for a photograph to painting a picture or repairing an image. There are many shapes that can be used with brushes. Some of them include the rounded rectangle, ellipse and polygon. The Pencil is used to draw on an image. The brush is used for erasing portions of the image. Fills are another type of tool used in Photoshop. These shapes come in the form of a ring, square, triangular or custom shapes. You can use them to create a texture, mask an image, define a background or make any other design element. There are several ways in which Photoshop fills can be used. For instance, you can use it to create a linear gradient, a radial gradient, a gradient with a white or black ring, pattern or texture. Photoshop Gradients The Gradient tool allows you to create a smooth transition between two colors. You can create different colors in one spot, like a round corner, or use it to create a transition from one image to another. The Pencil tool can be used to create a custom color with a brush or pen. You can use it for retouching images. The Mixer Brush is useful for setting the hue and saturation of an image. This allows you to make colors from a specific color or blend colors together. The Puppet tool is used for creating the illusion of transparency in an image. You can use the Gradient tool to create a gradient that will blend together. The Pen tool is used for creating custom shapes and paths. It is great for drawing, creating patterns and
