You can set it as short as 5 minutes up to 52 and can cycle through a number of slots. When you set a specific amount of time to complete, the Pomodoro timer alerts you when it is time to stop. As each task is completed, the timer resets. If a task is longer than the timer allows for, the application lets

you break it up into subtasks. Modern UI based on Google's Material Design Super Productivity features a dark theme by default, but it also allows you to apply one of six alternative themes. For example, you can add "Write a blog post" as a subtask of "Write a summary of my personal growth". You can also add the task's due date and estimate how long it will take to complete.

Worklogs are used to record the progress of completed tasks. These workspaces are useful for managing the progress of a project. Q: wordpress multi site - the url is not working right. how to fix? i have a wordpress multisite running on AWS. i use: `do_shortcode('[aspic_builder]');` to include my site in wordpress. For example, if it is `www.mysite.com/mango`, it is showing up properly. But if it is `www.mysite.com/yams` it is showing as `mysite.com/yams`, instead of staying at `www.mysite.com/yams`. i am developing this for a client so i don't have a lot of time to sift through the code, and I can't figure out why it is getting muddled. I'm not very versed in this, so I don't know if it is a redirect issue, a template issue, or a code issue. A: You can try using the same url on all of your sites. I

have a similar setup and it works just fine. For example on my dev site I have the following in a .htaccess file that I put in the root of my site:

```
RewriteEngine On RewriteCond  
%{REQUEST_FILENAME}!-f RewriteCond  
%{REQUEST_FILENAME}!-d RewriteCond  
%{REQUEST_URI}!\.(gif|png|jpg)$ RewriteCond  
%{HTTP_HOST} ^(www\.)?domain\.com$ [NC]  
RewriteRule ^(.*)$
```
