Spinal cord compression due to metastasis of primary lesions from rectal cancer is a rare complication of rectal cancer. Twenty patients with such metastases treated at our hospital between 1965 and 1994 were reviewed to determine the clinical features and the prognosis. In 5 cases, the visceral metastasis was the only one, in 10 cases the vertebral metastasis was the only one, and in 5 cases there were both visceral and vertebral metastases. Ten patients had solitary metastasis and 10 had plural metastases. Five patients had symptom of spinal cord compression only, 5 had severe pain with neuromuscular disturbance, and 7 had pain and sensory disturbance. Three of the patients had other sites of

visceral metastasis, lung in 7, and liver in 4. They all underwent operation. Median survival of the patients was 10 months after the operation. There was no significant difference in survival time among patients with single or plural metastasis. There was a significant difference in survival time between patients with operative and non-operative treatment. Peritoneal dissemination or liver metastasis was the predominant mode of visceral metastasis. These patients should be treated aggressively.
