Mechanisms of myelination in the human brain. The human nervous system contains a vast network of unmyelinated fibres and bundles of large myelinated nerve fibres that form a basis for complex integration and communication within the central nervous system. The small diameter unmyelinated nerve fibres lack the electrical resistance that is associated with the large, densely myelinated fibres and this allows myelin to effectively insulate axons, thereby facilitating fast and synchronous, and also energy-efficient, neuronal signalling. Myelin is a lipid-rich membrane structure, and it has several unique features including the presence of specialized proteins and sphingolipids, along with the requisite of a tightly regulated biosynthetic pathway. Assembling of myelin membranes is a complex process requiring the active role of many proteins that are in part genetically encoded in the human genome. During development, axons are still unmyelinated and the formation of myelin can be considered a prerequisite for long-term stable electrical signalling. In this review, we have summarized current knowledge on the mechanisms of myelin formation in the human brain, with a particular emphasis on the roles of the genes in human disorders associated with defective myelination.

Q: Are Questions about Programming in Java exclusively for .Net Users? Having watched the new StackExchange network develop and grow over the last year or two, I have noticed a trend. Many of the Questions which are asked on the various StackExchange networks appear to be written for people who have a lot of experience in using .Net. For example I just saw this question about how to speed up a serializer. This is a question that is normally best asked on StackOverflow, but on the StackExchange network, it was migrated to the .Net site of StackOverflow. This was an issue for me, because I am used to thinking of serialization as a part of the Java language. I left the question unanswered, but I would have thought it would have been more helpful if it had been moved back to Java. Are there other examples of questions being migrated to a .Net centric StackExchange network that are actually best answered elsewhere? A: There is a chance for both experiences, with the Stack Exchange's very opinionated nature that says it is for topics where multiple answers are allowed. The Stack Overflow is for all programming questions, not a little bit. Too much time is needed to discuss that topic on other places. I am in the opinion that Stack Overflow is not better than these kind of posts but I don't make a distinction. I think that a migration should take place when the best one is on this Stack Exchange Network and only in this case, since it is good to be able to see how a user uses the APIs and the languages on this platform. SO is about the programming, and it should be known that Java users like to discuss in how they use the language and the APIs and their alternatives on the other networks.
