Those particles can then provide fuel for the oncoming neutron, which begins a nuclear chain reaction, causing the critical mass that results in the explosion of the nuclear bomb. Although the tiny explosions are too small to be heard, the sound waves can travel for hundreds of miles and be picked up by man-made devices such as airport radar. A team of scientists last year discovered a high-frequency acoustic source at the former Russian spy base in Semey, Kazakhstan, which was used to construct the bombs during the Cold War, then abandoned.
