etap 16 is an enterprise solution for planning, performing, analyzing, optimizing and automating the electrical power systems. it is the most powerful analyzer of large scale network systems. with its advanced capabilities, you can simulate complex system that includes generators, transformers, and motors, as well as switchgear, instruments, and loads of all kinds. you can simulate one or more phases of the grid, or all phases at once, or even multi-phase power systems, and simulate individual substation or the whole power system. the advanced capabilities of etap 16 make it the perfect application to simulate whole distribution networks, or even the generator-inverter-load system. by means of its gantt chart, analysis tree, and block tree views you can evaluate your power systems with a single glance. and if you need more details, you can use special detailed views or project views. you can synchronize different sets of equipment parameters and save them as templates that can be used in different projects. you can synchronize a set of equipment and synchronize them to the net quantities, from one minute to years of operation. you can also check the accuracy of the measurements that you do in real time. the solution is designed for engineering, remote monitoring, and site management. etap 16 allows you to model the whole distribution system. you can do it in single phase with different load types and determine the total capacity of the feeder to which the load will be attached. you can use an e-substation model that is based on the wigner's equations for the correct specification of the substation bus in terms of phase short circuits. after you have selected a real-world feeder, you can build the grid network according to the requirements you provide with the parameters and synchronization details. 5ec8ef588b
