Portable SMTP Tester Crack Full Version Latest

SMTP Tester is a portable application whose sole purpose is to test SMTP servers. This means that it is not a mail client, so the only option left is to install an SMTP server in a real mail server, where mail can be received and send out with the help of this application. You have the option to select several services to test: - Internet SMTP (for sending and receiving emails) - POP3 (email server address) - IMAP (email server address) - EML (XML e-mail) - Simple Mail Transfer Protocol (SMTP) - Simple Mail Transfer Protocol (SMTP) - SSL- SMTP (Secure Sockets Layer) - SSL-SMTP (Secure Sockets Layer) - NNTP (Newsgroup) - NNTP-SSL (Newsgroup) - NNTP-SSL-SSL - UUCP (Unix-to-Unix Copy) - UUCP-SSL (Unix-to-Unix Copy) - HP-UX SMTP

(Host Protected Area) - HP-UX SMTP-SSL (Host Protected Area) SMTP Tester can also be used as a mail client to connect to an SMTP server. For that, you need to provide a username and password for the SMTP server and test the SMTP server, receiving and sending emails (SMTP mode). The received email messages are saved to a local folder, so that they can be accessed and examined. How To Install: 1. Unzip the archive 2. Double click SMTP Tester.exe to run the program Features: - Runs very low on the system resources - Very easy to use, even for novice users - Fast - Version 5.0 - Can be used as mail client (SMTP server is not needed) - Runs as portable application - Does not modify the Windows registry and does not leave behind any files - It's a free program, available for Windows only - Designed for Windows

2000/XP/Vista/7 System Requirements: - Internet Explorer 5.5+ (Windows 95, 98, 2000, XP, Vista, 7) - Windows Mail or any other mail client In order to get the best results, try and run the application on the same computer that you use to receive mail. Please note that SMTP Tester is not a replacement for the commercial

Portable SMTP Tester Crack +

%%HOME: Current working directory. %%WINPATH: Current working directory. %%DIRSEP: Current directory separator. %%PATHSEP: Current path separator. %%DIRNAME: Current directory name. %%PWD: Current path. %%TEMP: Temporary directory. %%WINDIR: Path to Windows directory. %%PATH: Path to directory

that contains.BAT,.EXE and other applications. %%CONFIG: SMTP server configurations. %%CONFIGPATH: Path to configuration file. %%CONFIGREAD: Content of configuration file. %%PROMPT: Prompt to be displayed when starting the SMTP server. %%COMPILED: A value to indicate whether the current configuration file was compiled. %%AUTH: An array with all email information that will be sent through the SMTP server. %%AUTHEMAIL: The email address of the sender. %%AUTHPASS: The password of the sender. %%AUTHFROM: The sender's address. %%AUTHSTATUS: Status of the email message. %%AUTHMESSAGE: The content of the email message. %%AUTHFROMUSER: The identity of the sender. %%AUTHPASSUSER: The username of the sender. %%AUTHFROMPASS: The password of the sender. %%AUTHSTATUSUSER: Status of the email message.

SMTP Tester is a tiny program that you can use to test your email server in five simple steps. It is designed to be intuitive and fast, using a simple interface that will not make you feel overloaded. Simply enter the server name, the mail sender and receiver email addresses, the recipient's email address, the subject and the message text. SMTP Tester detects the result in real time, so you can be sure that your message is successfully delivered to the person you were trying to reach. Each test result is saved into a log file that you can easily open later. You can find all of this information by choosing "Save Log File" from the main window's "File" menu. You can even delete the entire log file by using the "Clear Log" option in the "File" menu. How does it work? To

see how SMTP Tester works, simply follow the next steps: 1. Run the application and log in. You will find two options on the "File" menu: "Log" and "Quit." The "Log" option creates a log file that records all the information you have entered. You can choose to have this file saved on your hard drive or USB flash drive. The application will automatically log in when it starts for the first time. The default log file name is "test.log," but it can be changed by selecting the "File" menu and choosing "Save Log File" and entering a new name. 2. Enter the server name. This is the email address that you want to use to send an email to the person you were trying to contact, through SMTP (Simple Mail Transfer Protocol). The host is either an IP address or a domain name. If you were trying to test the SMTP server by using an IP

address, be sure to add ":port" to the address (where port is the port you want to reach, if it is not the default port). The example used in the screen shots below is "mail.example.com:25," which means that we were trying to reach the email server at mail.example.com on port 25. You can find the default port by looking in the right-hand corner of the email client where the email server's name is displayed. Example: The example used in the screen shots below is "mail.example.com:25," which means that we were trying to reach the email server at mail.example.com on port 25.
