InstallAware Virtualization is a lightweight, web-based application virtualization tool that allows you to take your applications and make them portable. This tool has no pre-requisites other than Internet access. Key Features: Simplifies deployment of application in the context of the operating system. Enables developers to run applications without installing them. Minimizes or eliminates the need to install new software on target computers, allowing you to run your applications in their native environment, eliminating the risk of the potential security holes introduced by updates or added applications. Minimizes the time required to convert your applications to a virtualized format, making it easier for you to be sure that you are providing the most secure solution possible for your customers. Works on all versions of Windows, from Windows 2000 and Windows Vista to the latest Windows Server 2008. Minimizes the need to deal with pre-extraction of application code, as all virtualization is done by a single, truly portable executable file. Applies only to one license per developer, so you do not need separate access licenses for every end user who runs the toolkit. Is based on a true agentless architecture, without requiring a desktop application for the end user to install prior to launching the virtualization toolkit. Does not require a desktop application to run, only a single true executable file that can run on any Windows-based computer. Does not require that an administrator be logged on when you launch the virtualization toolkit. No license-based or activation requirements, for either personal or company use. Applications which have been virtualized with InstallAware Virtualization can be deployed to end-user computers without the need to install any additional software.
