If you like to play in the dark, then Aperture is your program of choice. Not only is it simple, but it also allows you to import photos directly from your camera without making any adjustments. Apple's sidekick, *iPhoto* offers the simple ability to upload pictures directly to your photo library. However, it doesn't offer advanced customization or stability, and integration with other Apple products is limited. The last two free picks, *iPhoto Library* and *Lightroom*, are respectively a "lite" version and full version of the most popular photo editing software available. The perspective is quite different from Lightroom Classic CC. Whereas, Lightroom connects directly with your camera and automatically takes good quality, high dynamic range photos, *iPhoto Library* merely provides a means of preserving the original image. Last but not least, in the realm of file-based solutions, we have Capture One. Most people are familiar with the "normal" version of the software, which comes with decent RAW processing capabilities. However, the third iteration of Capture One (as of this date) includes a flat-file option that offers a versatile 2.8 GB (or almost 3 GB) of storage as well as a

new interface. Although this would be a major upgrade from its predecessor, it is much more difficult to master, and many people tend to go for its normal version. Although I have no clue what it feels like to use the software, the interface itself is kind of amazing. It resembles the interface of Microsoft Word: All features are laid out in a graphical interface and you are free to customize it to your liking. It has an extremely user-friendly interface that allows Photoshop users to have no trouble using it. Many people can't resist the temptation to buy the premium version of Capture One. To be honest, I think that they should've at least told people that it isn't "complete" from the start. Nevertheless, I am quite impressed by the difference.
